The JD Special is John Dienhart's original harrow design. A single tire mounting hole now provides the operator assurance that the harrow frame will be in correct level operating position before adjustments are made within the arena.

Two rows of S-tines provide twice the working accomplishment in one pass so tractor time is reduced. The spring tooth adds air or "cush" back into the footing, and does not allow you to dig into your base material.

The leveling Float Pan will provide light surface compaction and smoothing behind the harrow, leaving a beautifully finished, consistent surface.

The harrow rides on wide flotation tires which helps avoid compaction, as well as provide additional depth control and base protection.

Depth adjustment via the turnbuckle, for ultimate control ranging from zero to four inches.. Optional hydraulic option available.

The three point lift allows the tractor operator to back into corners, and provides adequate ground clearance when lifted for transport.
